

# Drive Added Business with Electric Vehicle Charging

In 2015, electric vehicles account for more than over 350,000 vehicles on the road. By 2025, experts predict that 15% of all cars sold will be electric. This significant growth in Electric Vehicles (EV) has fueled the demand for EV charging station solutions and electrical contractors to install them.

Today, over 70% of the networked charging stations installed in the US are ChargePoint stations. Electrical contractors and customers overwhelmingly choose ChargePoint for their customers for these simple reasons:

- + Easiest to install and configure - ChargePoint's installation videos and classes help you easily install and configure stations before or during your installation. To ensure your installation goes smoothly, ChargePoint stations include specialized tools and spring loaded splice boxes. Cut installation in half by using the dual port station option to serve 2 cars from one charging station.
- + Service - All service calls are covered by ChargePoint within the one-year parts and labor warranty, as well as during the optional, multi-year service agreements
- + Full featured hardware, software and connectivity - Stations are available in multiple configurations, including wall and bollard mounts and single or dual port to meet a variety of sites. ChargePoint's industry leading software includes automatic software updates and station owner telephone support as well as access control, pricing, reporting and real time monitoring.
- + Largest customer base - With nearly 25,000 stations installed, ChargePoint meets the needs of companies as diverse as Google, Raytheon, and the Atlanta Falcons. These and hundreds of other companies have selected ChargePoint after direct comparison with other station vendors.

Please contact Sunrise Electric Supply for pricing on the Industry leading, full turnkey ChargePoint EV Charging Station for your customers.
